gestió-renda

Production ERP for Blasco i Sanchis, an insurance brokerage in Alcàsser that also runs its clients' tax-return season.

This isn't a side project. It's software running the busiest season of a real firm, with real clients and real tax filings.

There's no public demo. It handles people's tax data, so the screenshots in this dossier are the only proof you'll get.

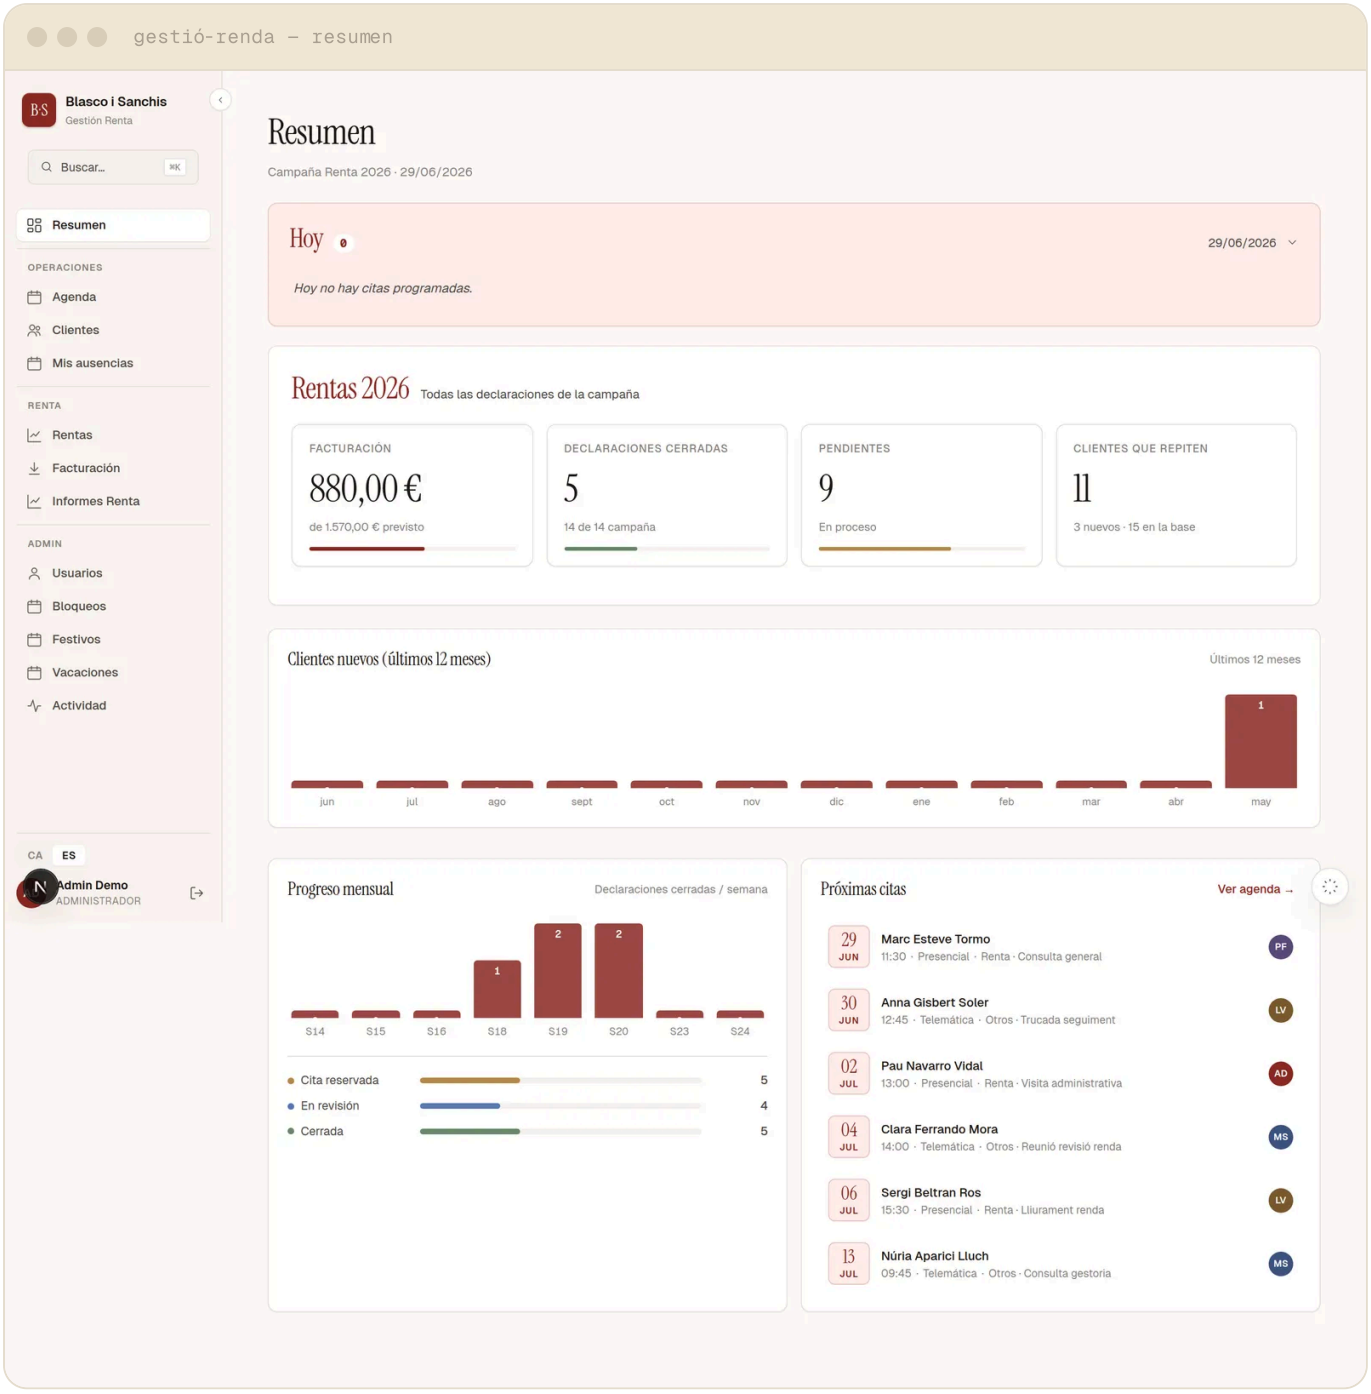

From scratch, solo. Schema, auth, database and the last comma of the CSS. When you own the whole thing, there's nowhere to hide.

Blasco i Sanchis · Alcàsser, València · 2026

01 The season's pulse

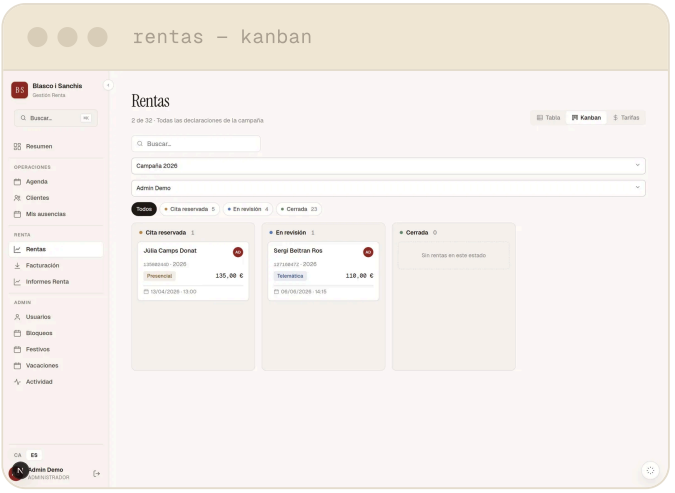

One glance and you know how April is going: revenue to date, filings by status, the day's upcoming appointments and charts that warn you before the problem becomes yours. What matters, on top, no digging required.

02 State machine

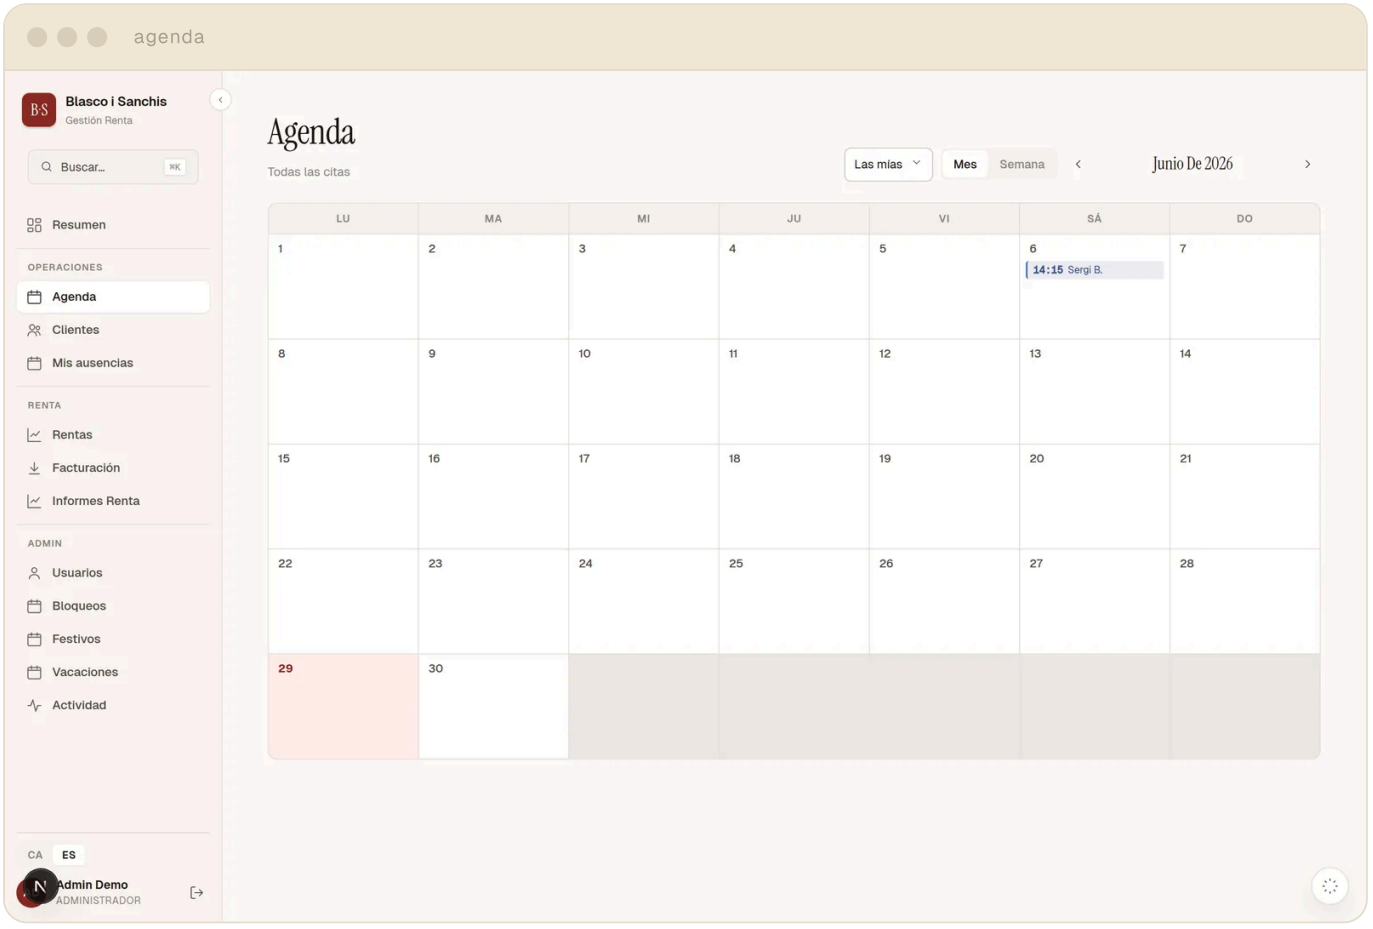

Every filing lives a life: booked → in review → closed. These aren't colored labels, it's a state machine that won't let you skip steps or lose a return along the way. Table view to work, kanban to understand, with rates and payments wired to each case.

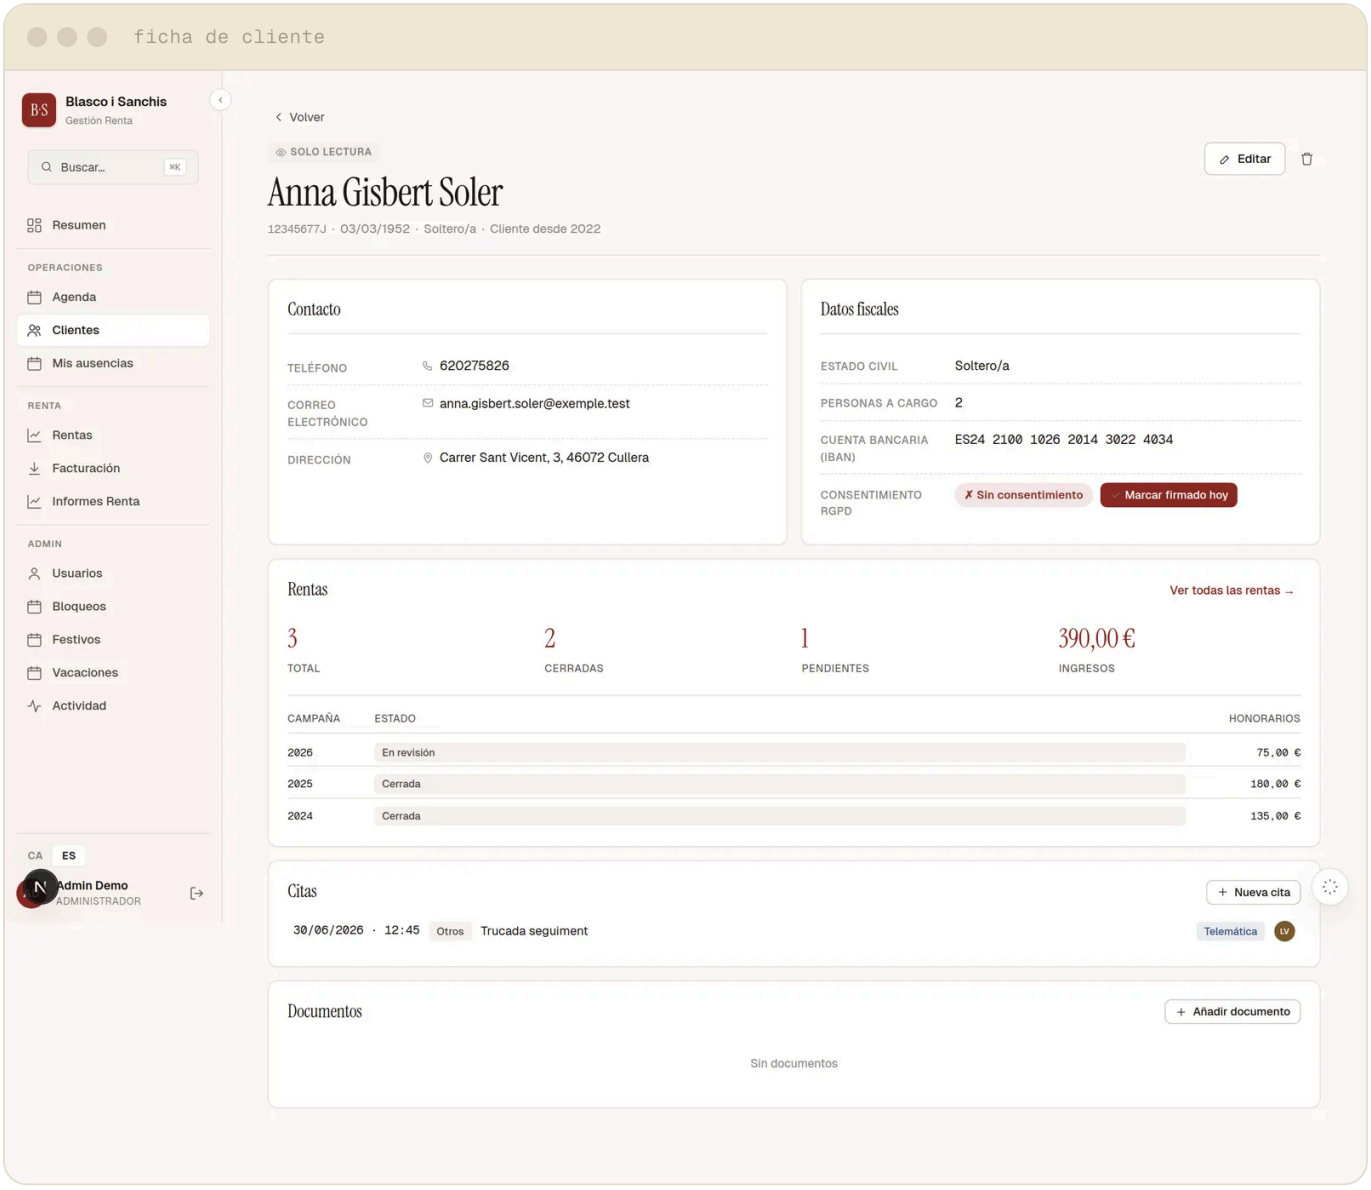

03 No double-booking

A whole season of appointments in a calendar that catches conflicts before two clients land in the same chair. Need to reschedule? Drag the appointment and done. The agenda defends itself.

04 Records that validate

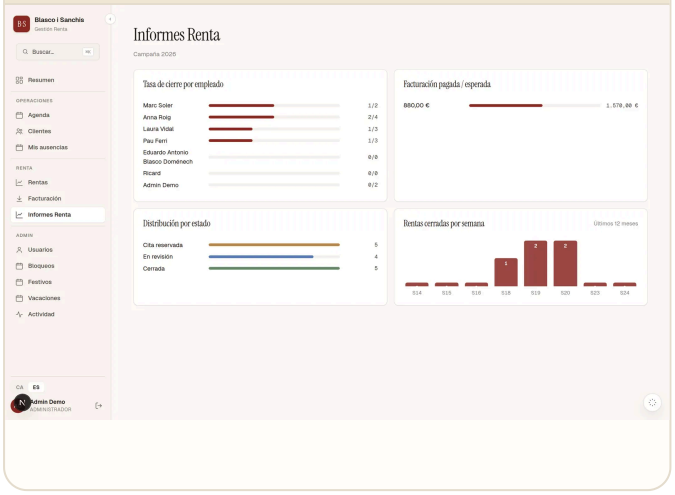

DNI, NIE, CIF and IBAN actually checked (yes, the IBAN mod-97 control digit too), not a text field that believes whatever you type. Tax data and GDPR consent where they belong, because here the wrong value has consequences.

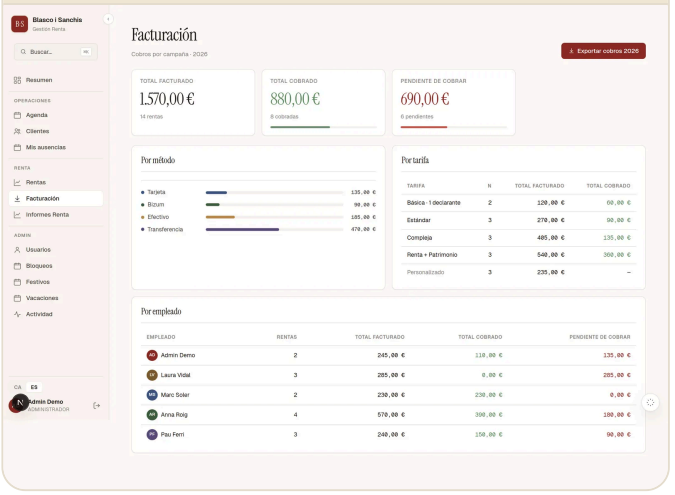

05 Reports and billing

Reports that tell you how the business is doing, and billing tied to each filing's rates. The numbers come from the system, not from a parallel spreadsheet praying it all adds up.

facturación

06 Everything's on record

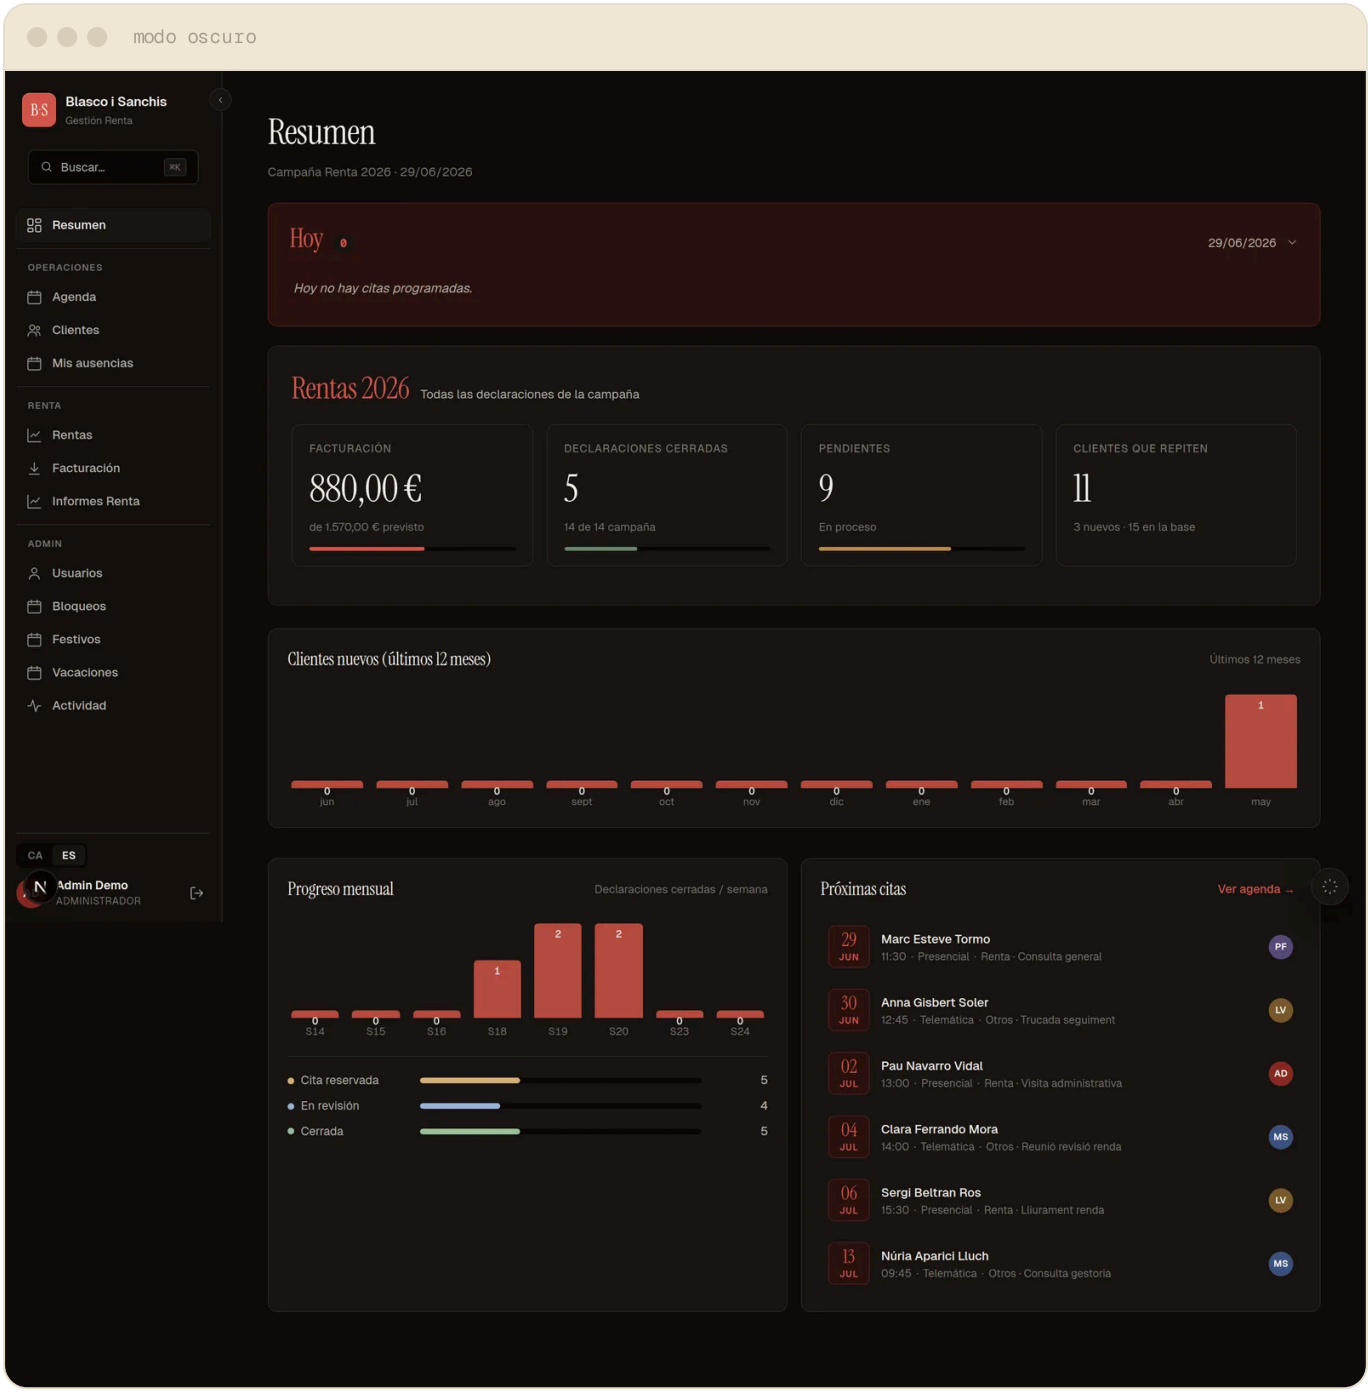

An audit log tracking who did what and when. When you work with tax data, 'no idea what happened' isn't an answer. Here you always know.

auditoría

07 Craft shows

Light and dark mode, genuinely bilingual CA/ES, and a command palette (Cmd+K) to move without touching the mouse. Details nobody asks for in the brief, but they separate a tool people use from one they tolerate.

Backend, database, auth, UI and product. Anyone can write a CRUD; the hard part is getting a

brokerage to trust you with their entire season.
This is that.
